

Energy efficient air source replaces outdated oil boiler

A home in rural South Norfolk has swapped an oil boiler for an air source heat pump and is enjoying the benefits of renewable heating thanks to Finn Geotherm.

The five bedroom detached house near Wymondham was built in the mid-1970s. Homeowner Paul Tyrrell was still using the original oil fired boiler but when the oil tank needed replacing, he began to look for a more modern and cost effective heating system.

Paul explained: "I considered an oil fired condensing boiler but, with the cost of the boiler, new tank and installation, let alone the additional ongoing costs for fuel, I knew there had to be a better option. I'd heard of air source heat pumps and began to research an alternative. I chose Finn Geotherm based on their expertise and non-pushy sales approach."

Finn Geotherm specified and installed a Panasonic Aquarea T-CAP 9kW air source heat pump with 210 litre Dimplex EC-Eau Smart cylinder including a combined 75 litre buffer. Paul also updated his heating system with 12 new radiators.

"My heat pump is fantastic," said Paul. "The house is always warm and there is plenty of hot water, even if we run two consecutive baths. The system itself is like magic – it just works and I don't even have to think about it. When our grandchildren visit, my wife and I also have the added peace of mind that it is very safe and our grandchildren are unable to scold themselves on the radiators or under the hot water tap. The RHI payments have been an added incentive to a system which is already saving me money on my heating bills."

"I can't fault the service from Finn Geotherm. Their approach throughout my project was very professional, highly knowledgeable and friendly. With the installation complete, I'm enjoying the benefits of air source while being cosy at home."

Key benefits:

- Significant reduction in heating bills
- Payments received under Domestic RHI
- Safe heating and hot water
- Low maintenance, future-proof system
